TITLE: Relay counter circuit

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika,
no. 7, 1962, abstract 7-1-71 ts. (Czech. pat., cl. 21a³
28/01, 21 a¹, 20/09, no. 97803, Dec. 15, 1960)

TEXT: A relay counter circuit is patented, which is suitable for various types of telephone systems. The basic use of the counter is the determination of the number of pulses in a dialling pulse train on a trunk line, and the emission of corresponding control pulses for the connection of the speech circuits at subscriber response or ring-off. The capacity of the counter is 4 pulses. The counter circuit uses 2-winding delayed relays, controlled by the dialling relay. The counter operates in a binary reflex (Gray) code, in which the beginning and end of a series of pulses are assumed to be different states (the beginning and end of sending the 4th, last, series of pulses is marked by the energization of only one relay in the counter). The response of the selected subscriber is represented.

Relay counter circuit

ted by the firing of the dialling relay and of the 1st relay of the counter, which ensures the connection of the subscribers. At subscriber ring-off, due to the firing of the control relay, the counter reverts to the state representing the end of the 4th dialling series. The counter circuit, a description of the sequence of operations and a diagram of the relay operation are given. 2 figures. [Abstracter's note: Complete translation.]

802. THEORETICAL ANALYSIS OF THE DESIGN OF A WAVEGUIDE LOAD FOR HIGH POWERS. V. Hubucek. Sbornikovy Obzor, Vol. 18, No. 7, 430-5 (1967). In Czech.

The load is a section of a rectangular waveguide whose walls are made of a mixture of cement and carbon. The paper aims at determining the dimensions of the load so as to meet the following requirements: (1) perfect matching; (2) uniform distribution of the absorbed power along the load and in all its walls; and (3) no sparking (breakdown) along the load. The analysis shows that the conditions cannot be fulfilled simultaneously. The load is therefore constructed in three sections, the first and the second of which fulfill the conditions (1) and (3) and partly the condition (2); the third section meets only the condition (3).

TITLE: Wideband Power Oscillators and Amplifiers with Crossed
Electric and Magnetic Fields

PERIODICAL: Československý časopis pro fyziku, 1960,
No. 5, p. 394

TEXT: The characteristics of some new oscillators and amplifiers of the magnetron type are discussed. The operating principles of this group of electron tubes are described and the constructional details of the individual tubes are mentioned. In particular, the functional details of the tubes which determine their characteristics are considered in some detail. The M-carcinotron, carmatron, amplitron and stabilitron are discussed. The characteristics and the relevant parameters of the various individual tubes are compared and their applications are discussed.

2224. Colorimetric determination of magnesium in water. E. H. Luchan and J. Mayer. Can. J. Chem. 1952, 30, 1071. Sample is precipitated as $Mg(OH)_2$ with $Mg(OH)_2$. Mg present in natural waters is usually sufficient, but to samples poor in Mg , add 0.5 ml of 20 per cent. $MgSO_4$. The ppt. is dissolved in H_3PO_4 , oxidized to Mn^{2+} with $K_2S_2O_8$ in the presence of Ag^+ as catalyst, and Mn is determined colorimetrically. Addition of $Hg(NO_3)_2$ eliminates error due to Cl^- . Low results are obtained in the presence of $CaSO_4$. To the sample (up to 10 l.-res), add 8 per cent. $NaOH$ to pH 12, decant the clear liquor, filter it, wash the ppt. with 4 per cent. $NaOH$, dissolve it on the filter in 20 per cent. H_3PO_4 (10 ml), and wash with water to make volume up to 20 ml. To the filtrate, add 0.5 per cent. Ag_2SO_4 (1 ml), a few drops of 10 per cent. $Hg(NO_3)_2$, and $K_2S_2O_8$ (0.1 g), heat on a steam-bath for 30 min., cool, add a crystal of $K_2S_2O_8$, and dilute with water to 50 ml. G. GLASS

TITLE: Numerical solution of some three-dimensional problems in the theory of filtration

SOURCE: AN UkrRSR. Dopovidi, no. 7, 1966, 839-843

TOPIC TAGS: filtration, hydrostatic pressure, hydraulic fluid

ABSTRACT: In the present article, closed solutions for several filtration problems are obtained on the basis of G. M. Polozhiy's method. A specific case is considered for the pressure filtration under a lock apron and a concrete dam. The solution of a three-dimensional filtration problem is reduced to finding the potential of the rate of filtration ϕ ,

$$\varphi = -\kappa h, h = y + \frac{p}{\gamma_0}$$

where h is the hydrostatic pressure, κ is the filtration coefficient, p is the pressure, γ_0 is the density of liquid, and y is the vertical space coordinate. Cases are considered with drained aprons, with the existence of definite drain sections, when the filtration region is bounded from the bottom not by the dam, but by a horizontal

Some experiments on the intermittency effect. Adolf Hnatch. *Phot. Korr.* 86, 1-6, 17-20, 33-40 (1951). — The intermittency effect is measured by the increase, Δ , in exposure time required to obtain a certain d , with the exposure split up into several partial exposures, compared with the same exposure given continuously. For const. partial exposure times, t , and dark periods, t_d , the value of Δ increases approx. linearly with the total exposure time (sum of partial exposure times). If Δ is plotted as a function of the frequency of the partial exposure times, the curves show a max. and a min. of Δ at certain frequencies. For "Vindolium brompaper" of Lainer and Hrdlička in Vienna with a total exposure time of 30 sec. and $t = t_d$, the max. value is curv at the frequency 4 to 5 per sec., the min. at approx. 25 per sec., with Δ again increasing at higher frequencies. The Agfa Astro Plate has its max. at a frequency of 7, the min. at 25. For const. total exposure time, Δ decreases asymptotically with light intensity. M. Bilz.

The influence of strophanthia, digitalis, and Novurit on blood coagulability. L. Dörner, J. Hnátek, and V. Malý (II. interní klin., Prague). *Časopis lékařů českých* 93: 1199-205 (1954).—Decreased coagulability of blood was demonstrated in 75 untreated decompensated cardiac patients with congestive heart failure (as compared with 45 controls) by the *in vivo* heparin tolerance times (I) and prothrombin activity. Factor V showed normal levels. The coagulability was enhanced after a single injection of Novurit (a Hg and theophylline-contg. diuretic); strophanthia caused no change, digitalis shortened the coagulation time very slightly. A theophyllineless mercurial diuretic, Neptal, had a similar effect as Novurit. Prothrombin activity was not changed by Novurit treatment. In patients compensated due to digitalis or strophanthia treatment, an increase of prothrombin activity was noted, explicable by the recovery of the liver function; only slightly significant shortening of I occurred in the group treated with digitalis. Novurit, digitalis and strophanthia had no influence on the clotting factors when mixed with plasma *in vitro*. I. M. Hall

"Biliary Excretion of Chloramphenicol, Erythromycin, and Neomycin"

Prague, Casopis Lekarů Českých, Vol CII, No 36, 6 September 63,
pp 981-983.

Abstract [Authors' English summary]: Chloramphenicol, erythromycin, and neomycin was administered parenterally to dogs. It was found that chloramphenicol and erythromycin were concentrated by the liver into the bile, while this was not the case with neomycin. Eight references, including 1 Russian.

Title : The Screening of Cellulose

Orig. Pub. : Papir a Celulosa, 13, No 10, 225-227 (1958)

Abstract : The author discusses the principles underlying the
screening of cellulose (C), the selection and loca-
tion of the screening equipment, the effect of vari-
ous factors on the operation of the latter, and the
control of the screening process. The opinion is
expressed that with properly conducted screening
good C can be produced from unbarked wood.

HNEVKOVSKY O. II. klinika pro orthop. a detskou chirurgii U. K. v Praze. Rodinne zatizeni u detski obrny Family taint in poliomyelitis Casopis lekaru ceskych, Prague 1949, 88/46(1328-1329) illus. 8.

In families in which several members contracted poliomyelitis, a disposition existed towards nervous or mental diseases either of infectious or degenerative character. The poliomyelitis often appeared in these families at a time when there was no epidemic. The pareses were more severe in the members of these families than among the other population. Probably there is a disposition in the members of stigmatized families to contract poliomyelitis.

"Role of Collagen Binding in Changes Observed in Vitro in Kidney
Cells During Ontogenesis of Donor."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 2, Feb 66, p 109

Abstract: The behavior of cells in ontogenesis differs according
to the age of the donor. The possibility that such behavior is
due to different amounts of collagen binding of the cells was
investigated. The cells were released from the tissue by trypsin
and cultivated in vitro; the differences persisted and it is
therefore assumed that they are due to ontogenetic changes in
cells proper and not to different amounts of intracellular
binding. 1 Figure, 5 Czech references. Submitted at "16 Days
of Physiology" at Kosice, 29 Sep 65.
